

Prompt 1 - Design a test strategy document for healthcare domain patient administration Chain of thoughts –

Context- Act as an Experienced QA Manager Instructions –

Design a test strategy document for healthcare domain patient administration. Each user have different role to access the application and screens are accessible. There are many roles in the application like nurse, doctor, patient, sign authority and so on..

[MANDATORY] Ask me question where you have any doubt one by one
[STRICTLY] Once after answering the first question go with next question
[CRITICAL] Once after answering all question, generate test strategy document in downloadable .docx format

Question 1:

Which modules or functionalities are included in the Patient Administration application scope?

For example:

- Patient registration
- Appointment scheduling
- Admission / discharge / transfer (ADT)
- Billing
- Insurance
- Electronic Medical Records (EMR/EHR)
- Role-based access control
- Notifications
- Reports
- Audit logs
- Pharmacy
- Lab integration
- Others

Please list the in-scope modules.

☐

Patient registration Appointment scheduling

Question 2:

Which platforms does the application support?

Examples:

- Web application
- Mobile application (Android / iOS)
- Tablet
- Desktop application
- API services only

Question 3:

What authentication and security mechanisms are used in the application?

Examples:

- Username/password login
- Multi-factor authentication (MFA)
- Single Sign-On (SSO)
- OAuth / Active Directory
- Session timeout
- CAPTCHA
- HIPAA compliance requirements

Please specify the applicable security/authentication requirements.

Single Sign-On (SSO)

Question 4:

Which user roles are currently in scope for testing?

Examples:

- Patient
- Nurse
- Doctor
- Receptionist
- Admin
- Sign Authority
- Billing staff
- Scheduler

Please provide the list of roles to be covered in the test strategy.

Lab systems Third-party scheduling systems EHR/EMR systems

Question 6:

What non-functional testing areas should be included in the strategy?

Examples:

- Performance testing
- Security testing
- Accessibility testing
- Usability testing
- Compatibility/browser testing
- Failover/recovery testing

Please specify which non-functional testing types are required.

Performance testing Security testing

Question 7:

What are the key environments available for testing and release?

Examples:

- Development (DEV)
- System Testing (SIT)
- User Acceptance Testing (UAT)
- Pre-production / Staging
- Production

Please list the environments you want included in the test strategy.

System Testing (SIT) User Acceptance Testing (UAT)

Question 8:

Do you have any specific compliance or regulatory requirements that must be considered for this healthcare application?

Examples:

- HIPAA (US)
- GDPR (EU)
- ISO 27001
- Local healthcare regulations
- Internal hospital compliance policies

Please specify any applicable compliance requirements.

HIPAA (US)

Question 9:

What types of test data constraints should be considered?

Examples:

- Use of **synthetic test data only** (no real patient data)
- Masked/anonymized production data allowed in lower environments
- Ability to create test patients on demand
- Restrictions on PHI (Protected Health Information)
- Specific data volume requirements (e.g., large patient datasets for performance testing)

Please specify your test data rules and constraints.

Use of synthetic test data only (no real patient data)

Please specify the platforms in scope.

Question 10:

What is the expected release frequency or delivery approach?

Examples:

- Agile (2-week sprints)
- Waterfall
- Continuous delivery / CI-CD
- Monthly releases
- On-demand releases

This helps define regression strategy and test cycles.

Agile (2-week sprints)

Great, we have all inputs.

Now I will generate the **Test Strategy Document** for Healthcare Patient Administration and provide it in a **.docx downloadable format**.

■ Generating Test Strategy Document

I will include:

- Scope (Patient Registration, Appointment Scheduling)
- Roles (Patient, Nurse, Doctor, Admin)
- SSO security model
- Integrations (Lab, EHR/EMR, Scheduling)
- Non-functional testing (Performance, Security)
- HIPAA compliance
- Agile 2-week sprint model
- SIT + UAT strategy
- Synthetic test data constraints
